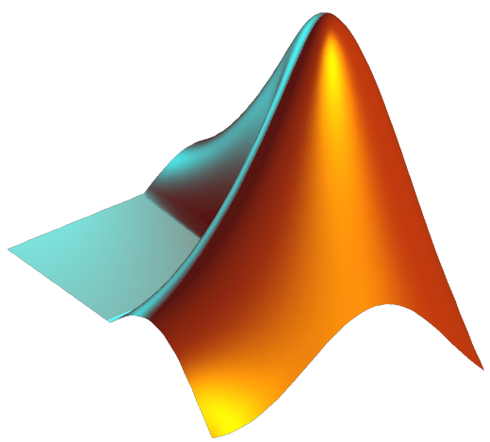
Provenance Scenarios

As a *<role>*, I want to *<goal>* so I can *<reason>*.

Use Cases 41, 46

As a *data analyst* using R or Matlab, I want to *keep track of my data input files, data output files and scripts* so I can *review my runs and potentially choose those to share with colleagues through an established DataONE repository*.



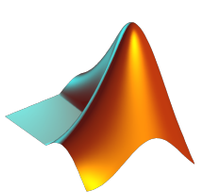
UC41, UC46

Will be using Matlab code examples

Configure | Record | Review | Login | Publish

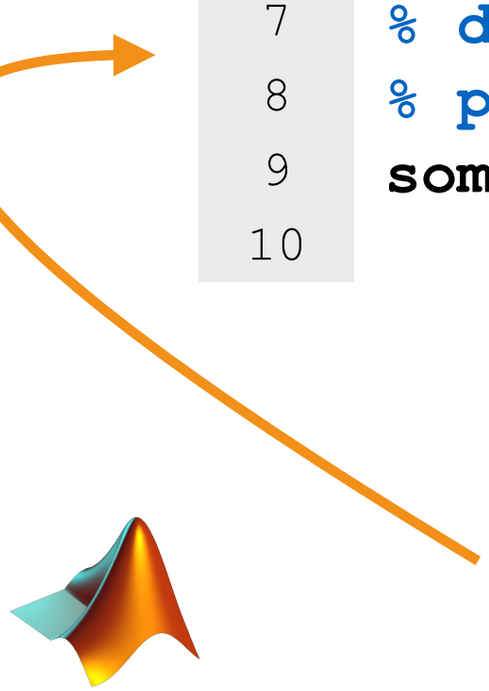
my_script.m

```
1   import org.dataone.client.configure.Configuration;
2
3   config = Configuration;
4
5   set(config, ...
6       'baseDirectory', ...
7       '/Users/cjones/matlab/runs');
8
9   set(config, ...
10      'sourceRepositoryBaseURL', ...
11      'https://mercury-ops2.ornl.gov/MSTMIP/mn');
```

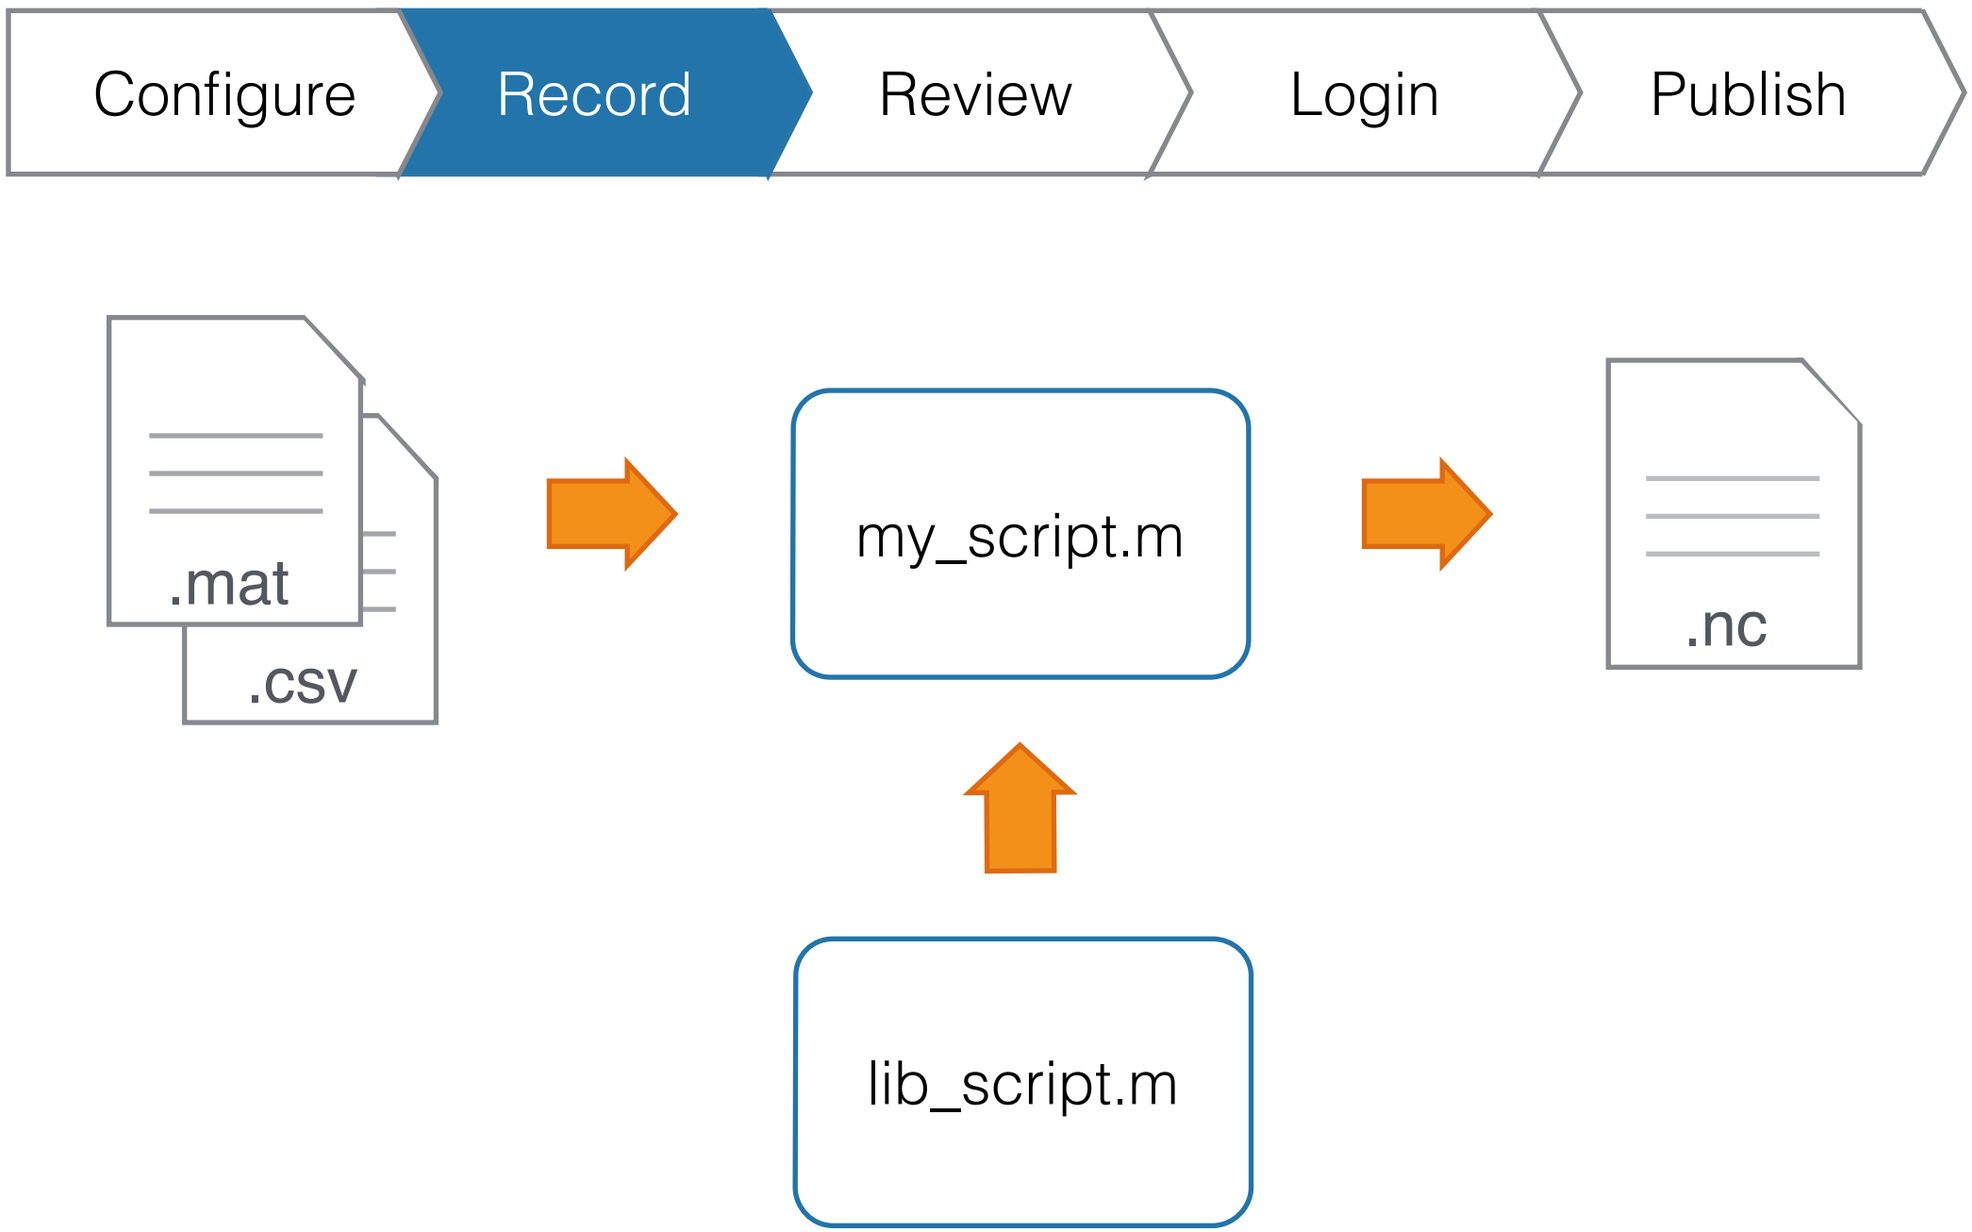


my_script.m

```
1   import org.dataone.client.configure.Configuration;
2   import org.dataone.client.configure.LabelParser;
3
4   parser = LabelParser;
5   parser.parse; % looks for config in comments
6
7   % d1prov:ingestStep
8   % prov:used, '/Users/cjones/data.nc'
9   some_array = ...
10      get_input_data('/Users/cjones/data.nc');
```



Alternative: develop a cross-language markdown-like annotation syntax and parsers

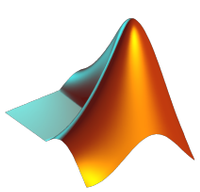


record() tracks input files, output files, referenced scripts, and the main script

Configure | Record | Review | Login | Publish

my_script.m

```
1   import org.dataone.client.run.RunManager;
2
3   runManager = RunManager;
4
5   runId = runManager.record('/Users/cjones/my_script.m');
6
7   % run your model analysis here
8
9
10
```



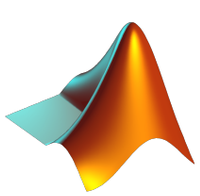
record() hides details of using insertRelationship() under the hood

my_script.m

```
runManager.list(); % Prints out summary about all runs

runManager.view(runId); % More details about a run

```

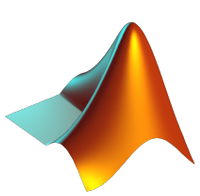


my_script.m

```
runManager.list(); % Prints out summary about all runs

runManager.view(runId); % More details about a run

```



The record/review cycle is iterative

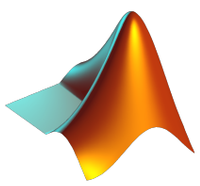
Configure | Record | Review | Login | Publish

my_script.m

```
1  runManager.view(execution.1.1);
```

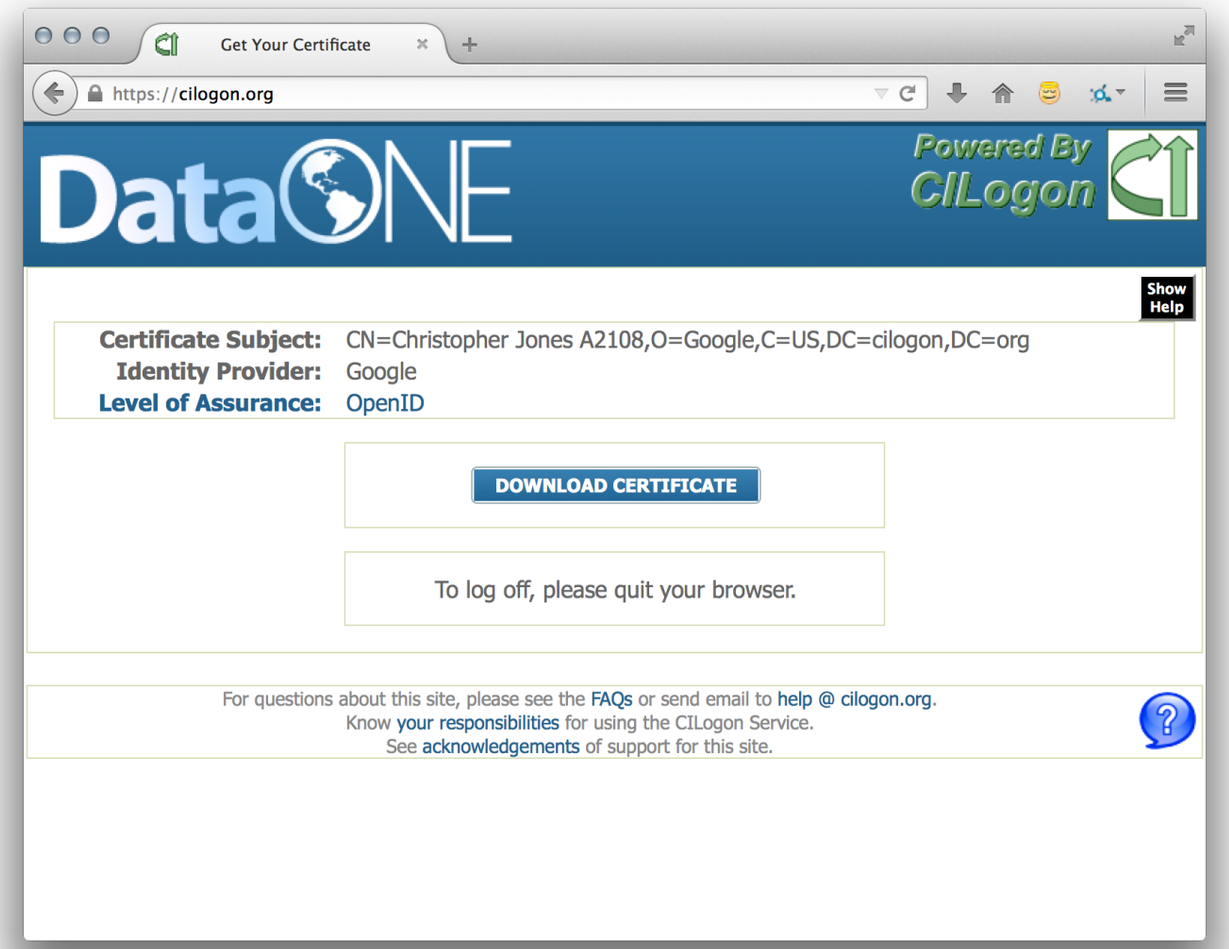
```
Run: execution.1.1
------------------
run start time:    Mon Sep 8 13:01
run end time:      Mon Sep 8 13:02
Matlab version:    2014a
Operating system: Mac OS X 10.9.5
Host name:         laurenshome

  Data Package: datapackage.1.1
  -----------------------------
  figure.1.1 was generated by execution.1.1
  execution.1.1 used data.1.1
  execution.1.1 used script.1.1
  data.1.1 is documented by metadata.1.1
  figure.1.1 is documented by metadata.1.1
  script.1.1 is documented by metadata.1.1
```



We need to to discuss what should be shown in summaries and details

Configure | Record | Review | Login | Publish



Login to DataONE and download your certificate

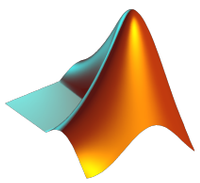
my_script.m

```
% Publish the data package to the repository
runManager.publish('datapackage.1.1');

```

RunManager will:

- create identifiers for each Data Package member
- upload each to the target DataONE Member Node
- upload the Data Package with all PROV relationships



UC 41/46 Todos

- Discuss the envisioned process (12-month goals)
  - Will it work? Are there gaps?
- Configuration Step:
  - Decide on programmatic vs inline-comment
  - Determine what configuration options are required
- Review Step
  - Discuss what is shown in summary and detail views

Use Case 42

As a *scientist*, I want to *be able to examine the original datasets used in a derived dataset I've found through DataONE* so I can *understand the history and composition of the derived dataset.*

UC42

Use Case 43

As a *scientist*, I want to *be able to find all derived datasets in DataONE that use my dataset* so I can *understand how my data are being used and by which colleagues.*

UC43

Use Case 44

As a *scientist reviewing derived tables or figures*, I want to *be able to examine the original datasets and the original script used to generate them* so I can *understand their history and composition.*

UC44
